***Allowable Subject Matter***

Claims 3-7, 9-19 are allowed.

The following is an examiner's statement of reasons for allowance: Prior art fails to teach an eye tracking system comprising a horizontal line camera, vertical line camera, a processor and a beam splitter configured to reflect a portion of an image of the eye onto one of the horizontal line camera and the vertical line camera and to pass a portion of the image of the eye onto the other one of the cameras as claimed in line 3; an optical element configured to optically focus an image of eye onto at least one of the horizontal and vertical line cameras before the image is captured by the at the least one of the camera as claimed in line 4; further including multiple controlled visible light sources coupled to the processor, wherein the processor controls the multiple light source individually to induce eye motion, and the processor further includes a statistical analyzer for comparing the tracked eye motions of a user to eye motion data derived from user to determine a measure of fitness as claimed in claim 5; a first beam splitter configured to reflect a portion of an image of the eye onto the horizontal line camera; a second beam splitter configured to reflect a portion of the image of the eye onto the vertical line camera; wherein the horizontal and vertical line cameras are configured to be outside of a field of view of the eye and the first and second beam splitters are configured to pass a portion of

an image of a scene in the field of view of the eye to the eye as claimed in claim 6; at least one infrared illuminator configured to illuminate the eye as images are being captured by the horizontal and vertical line cameras, the at least one infrared illuminator and the horizontal and vertical line cameras being controlled by the processor to control a rate at which sampled images are obtained from the horizontal and vertical line imagers as claimed in claim 7; a visible light illuminator configured to illuminate the eye as images are being captured by the horizontal and vertical line cameras, the visible light illuminator being controlled by the processor to induce contraction of the iris of the eye; and a pupil size monitor, in the processor, for tracking changes in size of the pupil of the eye in response to illumination of the eye in response to the visible light illuminator as claimed in claim 9; Regarding claim 11, prior art fails to fairly suggest an eye tracking system for tracking eye motion of a user having first and second eyes comprising a horizontal line camera configured to capture a horizontal image of at least a portion of the first eye of the user and a vertical line camera configured to capture a vertical image of at least a portion of the second eye of the user where the processor processes signal from horizontal and vertical line images of the eye to track motion of the eye as claimed.
